DESCRIPTION

The L5973D is a step down monolithic power switching regulator with a minimum switch current limit of 2.5A so it is able to deliver more than 2A DC current to the load depending on the application conditions. The output voltage can be set from 1.235V to 35V. The high current level is also achieved thanks to an SO8 package with exposed frame, that allows to reduce the $R_{th(j-amb)}$ down to approximately 40°C/W.

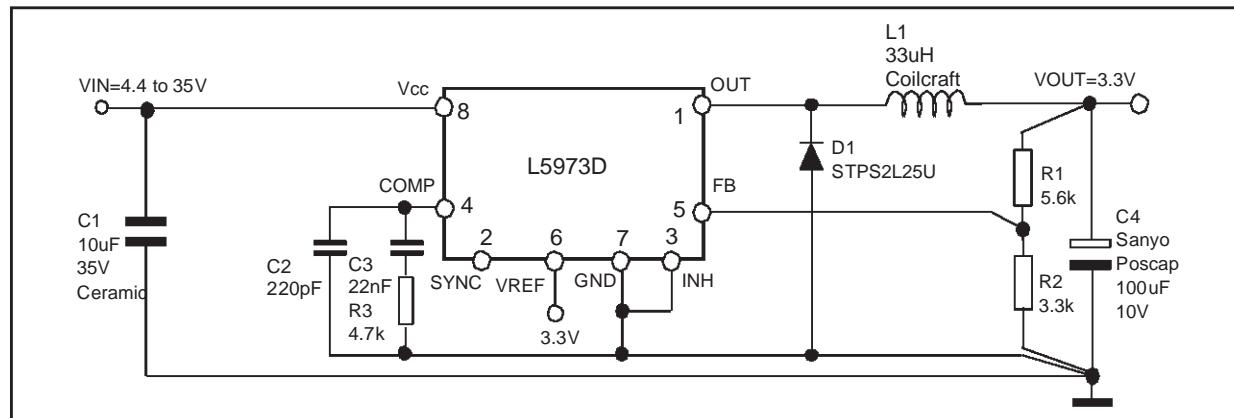

The device uses an internal P-Channel D-MOS transistor (with a typical R_{dson} of 250mΩ) as switching element to minimize the size of the external components.

An internal oscillator fixes the switching frequency at 250KHz.

Having a minimum input voltage of 4.4V only, it is particularly suitable for 5V bus, available in all computer related applications.

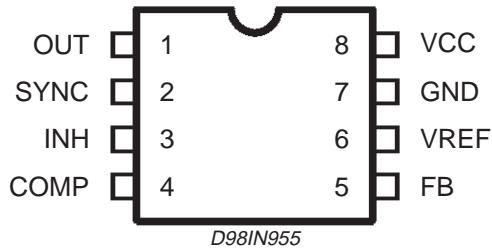

Pulse by pulse current limit with the internal frequency modulation offers an effective constant current short circuit protection.

PIN CONNECTION

PIN DESCRIPTION

N°	Pin	Function
1	OUT	Regulator Output.
2	SYNC	Master/slave synchronization.
3	INH	A logical signal (active high) disables the device. If INH not used the pin must be grounded. When it is open an internal pull-up disable the device.
4	COMP	E/A output for frequency compensation.
5	FB	Feedback input. Connecting directly to this pin results in an output voltage of 1.23V. An external resistive divider is required for higher output voltages.
6	VREF	3.3V V _{REF} No cap is requested for stability.
7	GND	Ground.
8	VCC	Unregulated DC input voltage.
